- Private practice in New

This course is designed for specialists and general practitioners who are interested in enhancing their bone grafting technique, especially for dental implant cases. Platelet-Rich Fibrin (PRF®) is derived from a small sample of the patient's blood, taken at the point of care and processed to develop a fibrin clot. The fibrin clot is prepared into a membrane that is rich in platelets, growth factors, and cytokines necessary to produce rapid healing and efficient regeneration.

This biomaterial is resilient, strong, and pliable, making it easy to manipulate. It can be cut to size and is supple enough to adapt to many anatomical areas. It is adhesive in nature, making it an ideal carrier for bone graft material. Uses for the material include bulking graft material (sticky bone), replacing graft material, using it as a barrier membrane, placing it in extraction sites for increased healing, and using it in guided tissue regeneration procedures. It is also ideal for extraction/immediate placement cases.

The hands-on training portion will teach you how to create the PRF membrane/plugs.
